```

```
sum(rowSums(txi.kallisto$counts)>0)
[1] 94561
  to.keep <- rowSums(txi.kallisto$counts) > 0
  kset.nonzero <- txi.kallisto$counts[to.keep,]</pre>
  keep2 <- apply(kset.nonzero,1,sd)>0
  x <- kset.nonzero[keep2,]</pre>
#PCR analysis
  pca <- prcomp(t(x), scale=TRUE)</pre>
  summary(pca)
Importance of components:
                            PC1
                                      PC2
                                               PC3
                                                     PC4
Standard deviation
                       183.6379 177.3605 171.3020 1e+00
Proportion of Variance
                         0.3568 0.3328
                                            0.3104 1e-05
Cumulative Proportion
                                            1.0000 1e+00
                         0.3568
                                   0.6895
  plot(pca$x[,1], pca$x[,2],
       col=c("blue","blue","red","red"),
       xlab="PC1", ylab="PC2", pch=16)
```

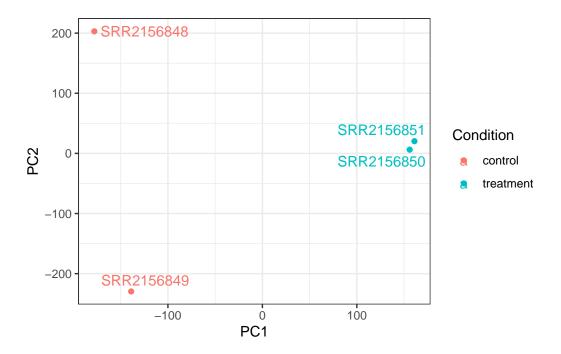

Q. Use ggplot to make a similar figure of PC1 vs PC2 and a seperate figure PC1 vs PC3 and PC2 vs PC3

```
library(ggrepel)

# Make metadata object for the samples
colData <- data.frame(condition = factor(rep(c("control", "treatment"), each = 2)))
rownames(colData) <- colnames(txi.kallisto$counts)

# Make the data.frame for ggplot
y <- as.data.frame(pca$x)
y$Condition <- as.factor(colData$condition)

ggplot(y) +
   aes(PC1, PC2, col=Condition) +
   geom_point() +
   geom_text_repel(label=rownames(y)) +
   theme_bw()</pre>
```

#Optional: Differential analysis

## library(DESeq2)

Loading required package: Biobase Welcome to Bioconductor Vignettes contain introductory material; view with 'browseVignettes()'. To cite Bioconductor, see 'citation("Biobase")', and for packages 'citation("pkgname")'. Attaching package: 'Biobase' The following object is masked from 'package:MatrixGenerics': rowMedians The following objects are masked from 'package:matrixStats': anyMissing, rowMedians sampleTable <- data.frame(condition = factor(rep(c("control", "treatment"), each = 2)))</pre> rownames(sampleTable) <- colnames(txi.kallisto\$counts)</pre> dds <- DESeqDataSetFromTximport(txi.kallisto,</pre> sampleTable, ~condition)

using counts and average transcript lengths from tximport

```
dds <- DESeq(dds)</pre>
```

estimating size factors

using 'avgTxLength' from assays(dds), correcting for library size

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship

-- note: fitType='parametric', but the dispersion trend was not well captured by the function: y = a/x + b, and a local regression fit was automatically substituted. specify fitType='local' or 'mean' to avoid this message next time.

final dispersion estimates

fitting model and testing

res <- results(dds)
head(res)</pre>

log2 fold change (MLE): condition treatment vs control
Wald test p-value: condition treatment vs control
