# Class06: R Functions

Irene (PID: A16197563) 2024-01-25

#### R functions

Functions are how we get stuff done. We call functions to do everything useful in R.

One cool thing about R is that it makes writing your own functions comparatively easy.

All functions in R have at least three things:

- A name (we get to pick this)
- One or more **input arguments** (the input to our function)
- The **body** (lines of code that do the work)

```
funname <- function(input1, input2){
   # The body with R code
}</pre>
```

Let's write a silly first function to add two numbers:

```
x <- 5
y <- 1
x+y

[1] 6

addme <- function(x,y=1){
    x+y
}

addme(1,1)</pre>
```

```
[1] 2
  addme(100,100)
[1] 200
  addme(10,10)
[1] 20
Lab for today
Write a function to grade student work from class
Start with a simplified version of the problem:
  # Example input vectors to start with
  student1 <- c(100, 100, 100, 100, 100, 100, 90)
  student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
  student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
Let's just find the average.
  mean(student1)
[1] 98.75
  mean(student2, na.rm = TRUE)
[1] 91
  mean(student3, na.rm = TRUE)
```

[1] 90

This is not fair - there is no way student3 should have mean of 90!

Come back to this NA problem. But things worked for student1

We want to drop the lowest score before getting the mean()

How do I find the lowest (minimum) score?

```
min(student1)
```

[1] 90

I found the which.min() function. Maybe this is more useful?

```
which.min(student1)
```

[1] 8

Cool- it is the 8th element of the vector that has the lowest score. Can I remove this one?

```
student1[which.min(student1)]
```

[1] 90

We can use the wee minus trick for indexing.

```
x <- 1:5
x[-3]
```

[1] 1 2 4 5

Now put these bits of knowledge together to make some code that identifies and drops the lowest score (element of the input vector) and then calculate the mean

```
mean(student1[-which.min(student1)])
```

[1] 100

or (exactly the same code)

```
# Find the lowest score
ind <- which.min(student1)
# Remove lowest score and find the mean
mean(student1[-ind])</pre>
```

#### [1] 100

Use a common shortcut and use x as my input

```
x <- student1
mean (x[-which.min(x)])</pre>
```

#### [1] 100

We still have the problem of missing values.

One idea is to replace NA values with zero.

```
y <- 1:5
y [y == 3] <- 10000
y
```

[1] 1 2 10000 4 5

Bummer, this is no good...

```
y < -c(1, 2,NA, 4, 5)

y == NA
```

[1] NA NA NA NA NA

У

[1] 1 2 NA 4 5

```
is.na(y)
```

### [1] FALSE FALSE TRUE FALSE FALSE

How can I remove the NA element from the vector?

```
!c(F,F,F)
[1] TRUE TRUE TRUE
   #y[is.na(y)]
  y[!is.na(y)]
[1] 1 2 4 5
  y[is.na(y)] <- 10000
[1]
         1
                2 10000
                             4
                                    5
Ok lets solve this:
  x <- student3
  #Change NA values to Zero
  x[is.na(x)] \leftarrow 0
  \mbox{\#Find} and \mbox{remove} \mbox{min} value and \mbox{get} \mbox{mean}
  mean(x[-which.min(x)])
[1] 12.85714
Last step now that I have my working code snippet is to make my grade() function
  grade <- function (x){</pre>
     x[is.na(x)] \leftarrow 0
     mean(x[-which.min(x)])
   grade(student1)
[1] 100
```

```
grade(student2)
[1] 91
    grade(student3)
[1] 12.85714
```

Lab Questions:

Q1. Write a function grade() to determine an overall grade from a vector of student homework assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an NA value) this can be used as a score to be potentially dropped. Your final function should be adequately explained with code comments and be able to work on an example class gradebook such as this one in CSV format: "https://tinyurl.com/gradeinput" [3pts]

```
grade <- function (x){
    x[is.na(x)] <- 0
    mean(x[-which.min(x)])
}

grade(student1)

[1] 100

grade(student2)

[1] 91

grade(student3)

[1] 12.85714</pre>
```

```
url <- "https://tinyurl.com/gradeinput"</pre>
  gradebook <- read.csv(url, row.names = 1)</pre>
  head(gradebook)
          hw1 hw2 hw3 hw4 hw5
student-1 100
                73 100
                        88
                            79
student-2
           85
                64
                    78
                        89
                            78
student-3
           83
                69
                    77 100
                            77
student-4
               NA
                    73 100
                            76
           88
student-5
           88 100
                    75
                        86
                            79
student-6
           89
               78 100
                        89
  results <- apply(gradebook, 1 , grade)
  results
 student-1
            student-2
                        student-3
                                    student-4
                                                student-5
                                                            student-6
                                                                        student-7
                 82.50
                                                    88.25
                                                                89.00
                                                                            94.00
     91.75
                             84.25
                                         84.25
student-8
            student-9 student-10 student-11 student-12 student-13 student-14
     93.75
                 87.75
                             79.00
                                         86.00
                                                    91.75
                                                                92.25
                                                                            87.75
student-15 student-16 student-17 student-18 student-19 student-20
     78.75
                 89.50
                             88.00
                                         94.50
                                                    82.75
                                                                82.75
Q2. Using your grade() function and the supplied gradebook, Who is the top scoring student
overall in the gradebook? [3pts]
  max(results)
[1] 94.5
  which.max(results)
```

A: The top scoring student is student 18 who get 94.5.

student-18

18

Q3. From your analysis of the gradebook, which homework was toughest on students (i.e. obtained the lowest scores overall? [2pts]

```
apply(gradebook, 2, mean, na.rm = T)
     hw1
               hw2
                         hw3
                                   hw4
                                             hw5
89.00000 80.88889 80.80000 89.63158 83.42105
  which.min(apply(gradebook, 2, mean, na.rm = T))
hw3
  3
To prevent outlier, to sum up the column instead of using average:
   which.min(apply(gradebook, 2, sum, na.rm = T))
hw2
  2
A: hw2 is the toughest on students.
Q4. Optional Extension: From your analysis of the gradebook, which homework was most
predictive of overall score (i.e. highest correlation with average grade score)? [1pt]
   # Make all (or mask) NA to zero
  mask <- gradebook
  mask[is.na(mask)] <- 0</pre>
   #mask
We can use the cor() function for correlation analysis.
  cor(mask$hw5, results)
[1] 0.6325982
   cor(mask$hw3, results)
```

I need to use the apply() function to run this analysis over the whole course (i.e.masked gradebook)

[1] 0.3042561

## apply(mask, 2, cor, results)

hw1 hw2 hw3 hw4 hw5 0.4250204 0.1767780 0.3042561 0.3810884 0.6325982

A: hw5 was most predictive of overall score.
